

**Supportive therapy in implant dentistry - working as a team to preserve healthy peri-implant tissues**

Saturday, May 12, 2012

8:30 PM - 9:30 PM

Olivier Carcuac

As the number of patients treated with dental implants continues to grow, the dentist and the members of the dental team are confronted with challenges of maintaining healthy peri-implant tissues around sometimes complex implant-supported restorations. Also clinicians who less involved in the active role in implant therapy meet patients who already carry dental implants. An evidence-based, team-oriented approach to supportive therapy is essential to ensure the longevity of dental implants.

The presentation will focus on supportive therapy including strategies in self-performed and professional infection control procedures.
